

## **NEWS RELEASE**

### **UBIqube's Enhanced MSActivator Platform with integrated support for Cisco ISRG2 series and the Cisco License Manager software**

*UBIqube's innovative Converged Services Delivery Platform (SDP) MSActivator™ enables Service Providers, System Integrators and MSSPs to expand beyond traditional services offerings while lowering delivery cost*

Paris-June, 2010 - UBIqube Solutions, a global integrated network, security and voice management solution vendor, today announces the full support of Cisco ISRG2 800 1900 2900 3900 series and CLM (Cisco License Manager) in UBIqube's MSActivator™ platform.

MSActivator offers a unified solution to provision, monitor and report on network, security and voice managed services. It lowers operating expenses through standardization and service management automation and allows CSP's to very quickly bring new managed services to market.

MSActivator™ now features an easy to use web-based interface to the Cisco License Manager server (CLM). This new platform module enables users to easily manage licenses for their Cisco devices leveraging the Cisco License Manager features directly through the vSOC console. Using UBIqube's web-portal, users can add Product Activation Key (PAK), collect the associated licenses and deploy them on managed devices in a few clicks. This new asset is particularly relevant for new Cisco devices.

The main features of the new MSActivator release are summarized below:

- Out-of-the-box support for provisioning of Cisco ISRG2 devices
- Attach managed devices to a CLM server in one click
- Retrieve activated service license keys and provision ordered features on managed devices
- Manage Cisco licenses process lifecycle on devices from a single tool

Building on Cisco CLM software, UBIqube MSActivator brings additional value to its customers by drastically simplifying the complexity in the administration of the new integrated features. With UBIqube MSActivator, customers can create service bundles and manage complete service life cycle using a single tool, from service definition to deployment of the required per-feature license keys, streamlining the order to activation workflow process.

“With the advent of the next generation ISR devices, which require a license activation process, license management has become a critical issue for Cisco partners. With the UBIqube MSActivator CLM module, these tasks in effect become simple and get automated within the overall solution workflow. Additionally, the associated APIs streamlines the integration of license management in the SP IT process removing the silo issue. Off-line licence activation will avoid the security breach posed by permanently internet connected

devices. , said **Hervé Guesdon, UBIqube's Director of Engineering and Product management**

### **About UBIqube Solutions**

UBIqube develops converged next generation management solutions for the IT and Managed Services Industry:

**MSActivator** SDP is the corner stone SW platform for converged services deliver and management (Network, Security and VoIP).

**SmartSOC** *Unified Management appliance* is the one stop shop solution for a CIO and point Network, Security and VoIP Management challenges.

UBIqube's Engineering is in France with sales offices in Paris, Dubai, DC, Delhi, Moscow and Budapest.
